The page shows a progress bar for "Dictionary Operations" at 100% completion. A sidebar on the left lists five practicals, all marked as 100% completed. The main content area shows a list of practicals, each with a progress bar and a "Resume" button.

5.2.11. Scatter Plot for Age vs. Fare by Survived

Write a Python code to plot a scatter plot showing the relationship between the 'Age' and 'Fare' columns in the Titanic dataset, with points color-coded by survival status. The scatter plot should display the following specifications:

1. Use the **Age** column for the x-axis and the **Fare** column for the y-axis.

2. Color the points based on the **Survived** column: **Red** for passengers who did not survive (**Survived = 0**). **Blue** for passengers who survived (**Survived = 1**).

3. Set the title of the plot to **"Age vs. Fare by Survival"**.

4. Label the x-axis as **"Age"** and the y-axis as **"Fare"**.

The Titanic dataset contains columns as shown below.

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked
1	0	3	Brandy, Mr. Owen Harris	male	22	1	0	5	21571	7.25	S
2	1	1	Cunings, Mrs. John Bradley (Florence Briggs Thayer)	female	38	1	0	PC 17599	71.2833	C85	C
3	1	3	Heikkinen, Miss. Laina	female	26	0	0	STON/O2	31.0000	7	S
4	1	1	Vuorella, Mrs. Jacques Heath (Lily May Peel)	female	35	1	0	113803	53.1	C123	S

2.2.1. Linear search Technique

Write a program to check whether the given element is present or not in the array of elements using linear search.

Input format:

The first line of input contains the array of integers which are separated by space

The last line of input contains the key element to be searched

Output format:

If the element is found, print the index.

If the element is not found, print **Not found**

Sample Test Case:

Input:

12 3 4 5 6

3

Output:

2

CTP1709...

1list=input().split()

2e=input()

3if e in list:

4print(list.index(e))

5else:

6print("Not found")
